maat

by Sandro Barbazza

Intelligent Personal Planning and Organization System

maat is a personal planning and organization platform that brings Apple Calendar and Reminders together in a shared, individually customizable planning layer.

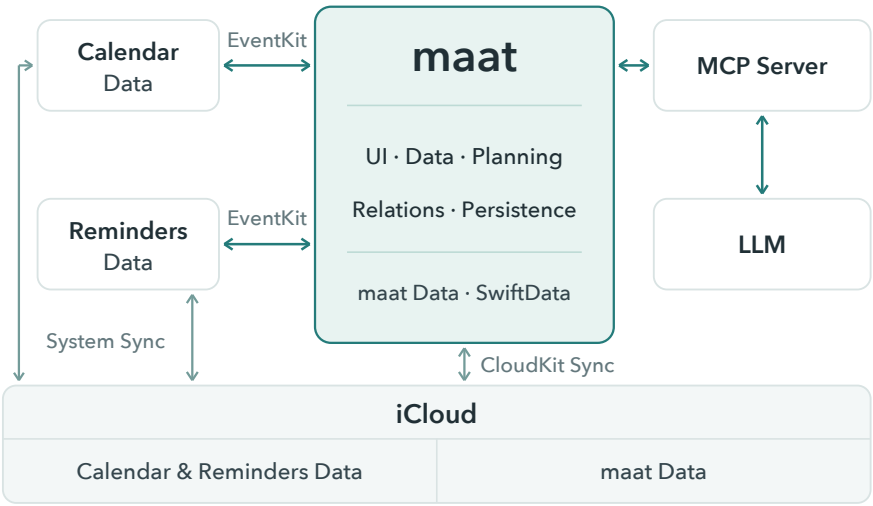
Problem & Goal

Apple Calendar and Reminders offer extensive functionality for events, deadlines, and tasks, but present them largely separately. maat adds a shared organizational layer to both applications, in which their data can be integrated bidirectionally, linked to one another, and adapted to an individual planning workflow.

Core Features

- Bidirectional integration of Apple Calendar and Reminders
- Linking and categorization of tasks, events, and deadlines
- Flexible daily, weekly, and Kanban views
- Organization and planning of tasks based on available time, deadlines, and priorities
- Semantic access and planning through natural language via MCP and an LLM

Architecture



MVP / Scope

The goal is a functional prototype for macOS, iOS, and iPadOS that covers the core features listed above.

Advanced automated planning, complex task dependencies, additional data sources, and more extensive LLM functionality are possible extensions.

Development Plan

1	2	3	4	5
Foundations & Data Model	**Integration & Synchronization**	**User Interface & Organization**	**Planning & MCP**	**LLM Integration & Evaluation**
Project structure, internal data model, and access to Apple Calendar and Reminders.	Bidirectional data exchange and maat-specific relationships between the data.	Daily, weekly, and Kanban views, as well as categories and links.	Identification of available time slots, basic planning, and structured access to planning data.	Natural language queries, planning suggestions, and evaluation of the prototype.

Technologies & Tools

Technology Stack: Swift · SwiftUI · EventKit · SwiftData · CloudKit · MCP

Development & Tools: Xcode · Git/GitHub · LLM assistance
